
AGND
Function: J1 is a single AGND pin. It is not fitted: marked do-not-populate, left out of the BOM and left out of the position file. Its hole and AGND connection stay on the board.
Source / changes: Inherited from the ASIC designer's board; not a datasheet circuit.
Changed in V6 by Claude: the DNP and BOM flags (meeting 12 Nov 2026, answer E6: J1 is not needed), record 2026-11-12_FPGA_Work/07_Meeting_With_ASIC_Designer_V1/MEETING_NOTES_V1.md. Changed in V7 by Claude: the position-file flag, as on the top board. Symbol, footprint, position and net are unchanged.
chipU01_BCD_OFF_CHIP
*
U01_BCD1
Function: The DISC_OUT finger of U01_BCD1 is left open (no-connect flag). Nothing on this board reads or drives it.
Source / changes: Inherited from the ASIC designer's board pair; not a datasheet circuit.
Changed in V6 by Claude: the wire stub and the label DISC_OUT at this finger are removed, so the finger is no longer joined to connector pin 5. Reason: meeting with the ASIC designer, 12 Nov 2026, answer A3 (DISC_OUT is not needed and need not be connected), record 2026-11-12_FPGA_Work/07_Meeting_With_ASIC_Designer_V1/MEETING_NOTES_V1.md. Not verified by us: that an open DISC_OUT finger is harmless (designer's statement; no chip datasheet).
J3
Conn_02x40_Odd_Even
J4
Conn_02x40_Odd_Even
Function: J3 pins 3 and 5 pass straight through to J4 pins 3 and 5 under their present net names, DISC_OUT(2) on pin 3 and DISC_OUT on pin 5. They carry nothing on this board.
Source / changes: Pin order inherited from the ASIC designer and final (meeting 12 Nov 2026, answer A1), record 2026-11-12_FPGA_Work/07_Meeting_With_ASIC_Designer_V1/MEETING_NOTES_V1.md; not a datasheet circuit. Changed in V6 by Claude: both chips' DISC_OUT fingers are taken off these two nets (answer A3); labels, pins and names at J3 and J4 are untouched. Not verified: what the mating boards put on pins 3 and 5 (answer A4, not discussed: leave them unconnected there).
